

SPACE PLANNING THINKING INSIDE THE BOX

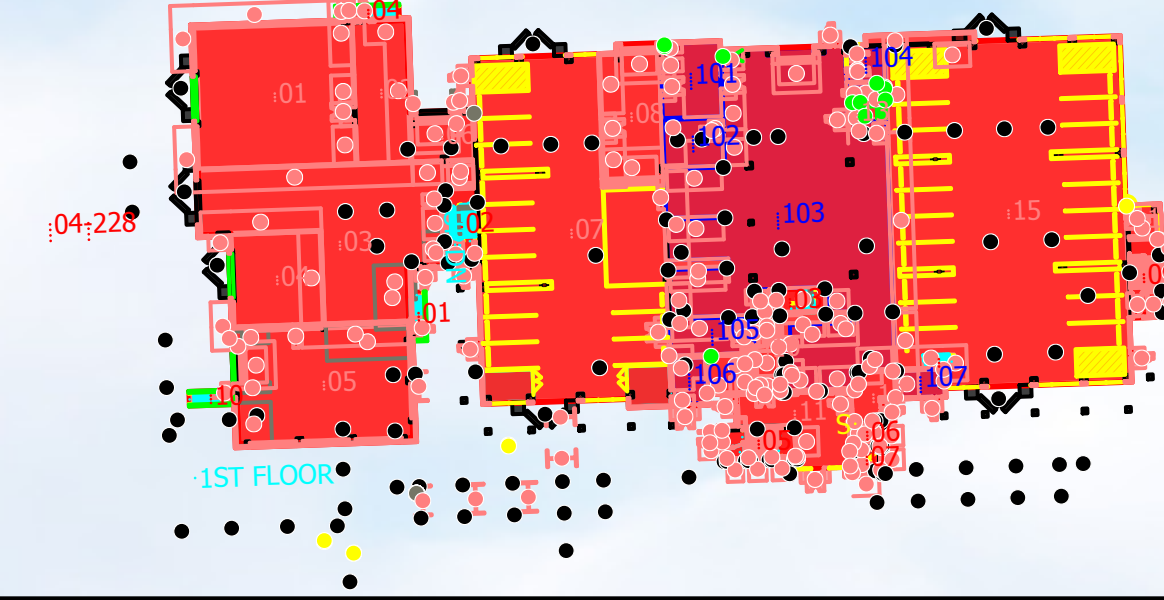

Basemap Creation

Great interior spaces start with an accurate exterior basemap. Utilizing heads up digitizing and orthoimagery, the campus was designed around our georeferenced building footprint.

Raw CAD Data

This data is beneficial for construction but less useful for GIS facilities management. Excess layers associated with CAD files can be confusing and create a messy look.

GIS Conversion

Converting CAD files to GIS removes excess layers and annotation that previously cluttered the map, producing a cleaner look in GIS.

UAS Imagery

Point cloud generated from in-house UAS team. This program can help with roof and building management inspections.
